

ISCHAEMIC HEART DISEASE (IHD): INITIAL ASSESSMENT

¹Chest pain caused by ischaemic heart disease. ²ECG may show ST segment depression or elevation, but a normal ECG does not exclude diagnosis of unstable angina or heart attack. ³ST elevation > 1mm in two or more contiguous limb leads or ST elevation > 2mm in two or more contiguous chest leads. ⁴Discuss use of alteplase with specialist/referral hospital. ⁵Dilute 10mg **morphine** with 9mL of sodium chloride 0.9%. Give diluted morphine 5mL IV over 5 minutes (1mL/minute). If needed, give another 1mL/min until pain improved, up to 10mL. Stop if BP drops < 90/60.
